The activity in de-carbonizing is one that varies with the temperature and this fact also seems to apply with equal force inversely to phosphorus. The term very hot may seem indefinite in reference to the bath when melted, but in the absence of figures stating temperatures at the several stages of an open-hearth heat, the use of vague expressions concerning them cannot be avoided. It is doubtful if the slight ranges of temperature covering the periods affecting the removal of phosphorus can be observed by the eye even with experienced operators. It is certain that the ranges of temperature in question come within apparently normal conditions and are therefore narrow. But, if the ranges were wider, they would be readily detected...
